

Pattern Recognition And Machine Learning

Project Report

Name	Rishabh Jain
Roll number	B20EE083
Project Name	Bitcoin Price Prediction

1) Preprocessing and Visualization→

➡ The date column isn't relevant in the supplied dataset, thus we removed it.

➡ We eliminated the final few rows since the volume value was not provided.

➡ The data is in string format in the columns 'Volume' and 'Market Cap.' I fixed that by removing the commas and converting them to integers.

Correlation Heatmap→

- If the value is 1, it is said to be a **positive correlation** between two variables. This means that when one variable increases, the other variable also increases.

2). Regression Models→

🔍 Why Regression Models ?

When we want to predict a continuous dependent variable from a set of independent factors, we use regression analysis.

I chose the following Regression model →

① Decision Tree Regressor ② Random Forest Regressor ③

AdaBoostRegressor

④ Linear Regressor

⑤ KNeighborsRegressor

① Decision Tree Regressor → Decision tree regression analyzes an object's characteristics and trains a model in the form of a tree to predict future data and create useful continuous output.

② Random Forest Regressor → A random forest is a meta estimator that employs averaging to increase predicted accuracy and control over-fitting by fitting a number of classification decision trees on various sub-samples of the dataset.

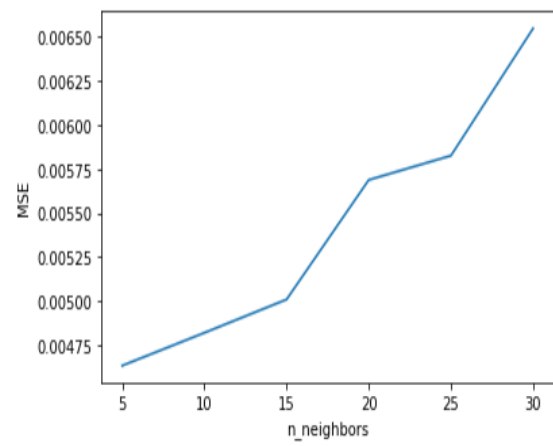

③ AdaBoostRegressor → An AdaBoost regressor is a meta-estimator that starts by fitting a regressor on the original dataset, then fits further copies of the regressor on the same dataset, but with the weights of instances changed based on the current prediction's error.

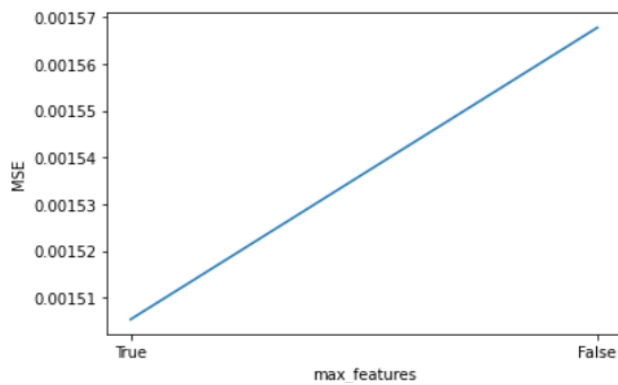

④ Linear Regression → A linear technique to modeling the connection between a scalar response and one or more explanatory factors is known as linear regression (also known as dependent and independent variables).

⑤ KNeighborsRegressor → KNN regression is a non-parametric approach that approximates the relationship between independent variables and continuous outcomes by averaging data in the same neighborhood in an understandable manner.

I Varied the following **hyper-parameters** in order to get the better Accuracy →

The plot of MSE v/s parameters are shown below.

Respective Model and their respective MSE (after Hypertuning)→

Model	MSE
DecisionTreeRegressor	0.103921
RandomForestRegressor	0.00172109
AdaBoostRegressor	0.014899
LinearRegressor	0.000648642
KNeighborsRegressor	0.00393834

Result→ We observed that **LinearRegressor** is performing best for the given dataset.
